

Executive Summary

The Problem

Currently, it is extremely difficult for motorsport fans to manage the multiple international championships that they watch. The process would be that the user must find the time in which a race is happening. In some cases, they would then need to convert the time zone themselves. Lastly, they need to keep track of when sessions are happening and set reminders for when the session is about to start. There should be an application that simplifies this process. There are some pre-existing applications that can solve this problem, but only to a limited extent. For example, the Formula 1 application does a good job of allowing a user to view motorsport information, session times in their own time zone and receive alerts for when sessions are happening, but this is just limited to Formula 1. There is a gap in the market for an application to allow this to happen for multiple motorsport championships.

The Solution

The project consists of a mobile application that allows motorsport fans to track various motorsport championships of their own choosing, allowing them to view upcoming sessions on their personalised home screen and receive alerts when a session is about to start. They can view all the information they need, such as the track, the session results, the session times in their own time zone, as well as where they can watch the session. The user can also manage their own devices, and sync accounts across multiple devices to access the information and receive alerts. This application aims to simplify the current monotonous process of an individual having to find session times from a championship's website, convert the time zone themselves, and schedule the different championships that they watch.

Prototype Report

Prototype Overview

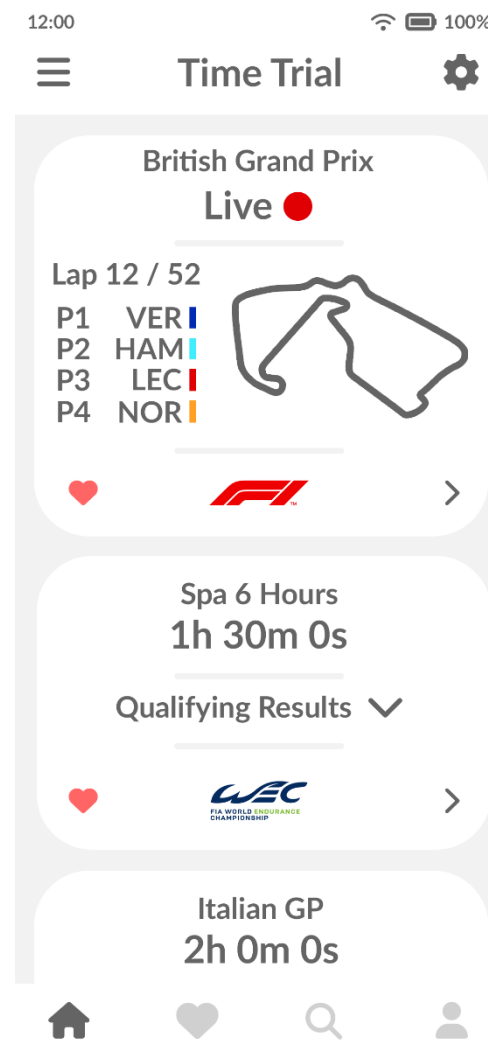

The application consists of several features that delivers a useful and informative experience for the user. Overall, the application provides a centralised location for motorsport fans to track multiple championships of their choosing. They will be provided with information such as session results and session times, as well as receive alerts for when sessions are about to start. They can also use the application on multiple devices using an account system and receive information and alerts on these devices. The different features of the prototype used to deliver this information to the user will be broken down into sections and explained in detail.

The Home Page

The home page is the centralised location where the user will view all the main information. It will also act as a gateway for the user to view additional information on specific motorsports. When the user initially opens the application for the first time, they will be greeted with an empty home page. For items to appear on the home screen, they must like motorsports for them to appear.

Once the user likes motorsports from the search page, it will appear on the home page. They will be greeted with information about the next upcoming session. This will include a countdown to when it is happening, a general overview of the track and its layout, and a small amount of information about the previous session results. If a session is currently undergoing, then it will display the session live with the session's current order.

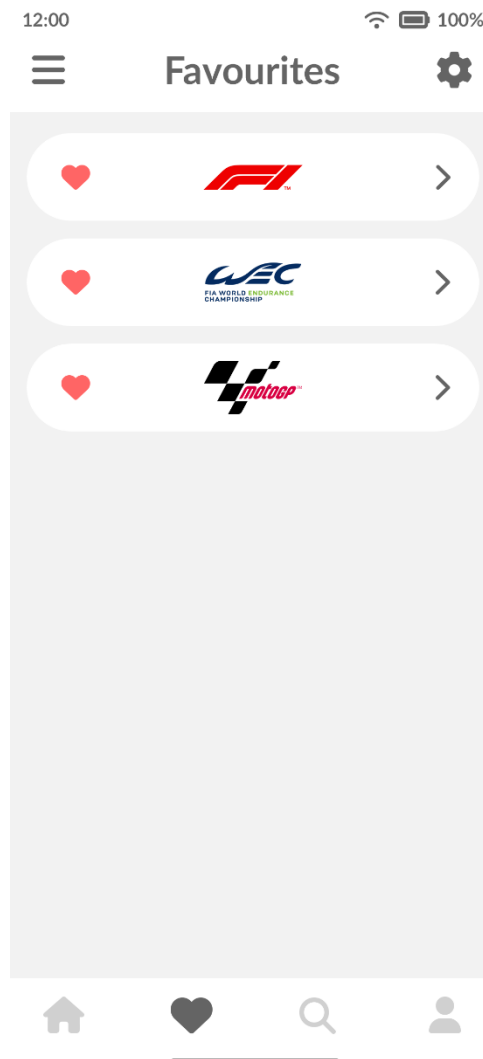

Information on the home page will be sorted in chronological order. The closest upcoming session will be displayed at the top of the page and will descend to the next session. In each tile of information, the user can choose to unfavourite the motorsport, which will remove it from the home page, or they can choose to go to the specific motorsport page, in which they can see more information about the sessions.

Favourites

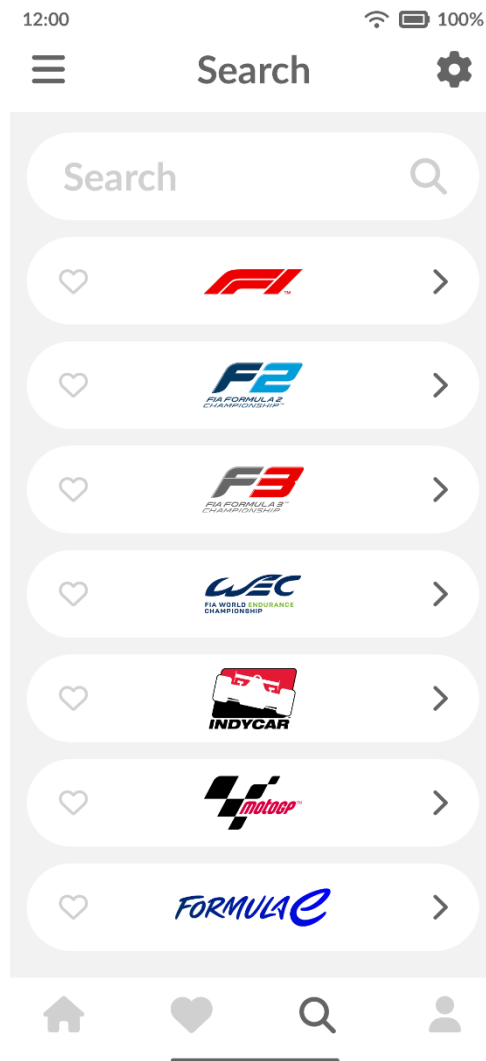

The favourites page displays a simple and manageable list of motorsports in which the user has liked. This allows the user to easily manage which motorsports they want to keep and which ones they may want to remove. This simple list acts as an alternative to the home page, in which the user can easily view the motorsports they

have liked in a more simplified format. From the favourites page, they can also view championships that may not be present on the home page, such as when a championship is undertaking its off-season, saving the hassle of searching for a specific motorsport through the search page.

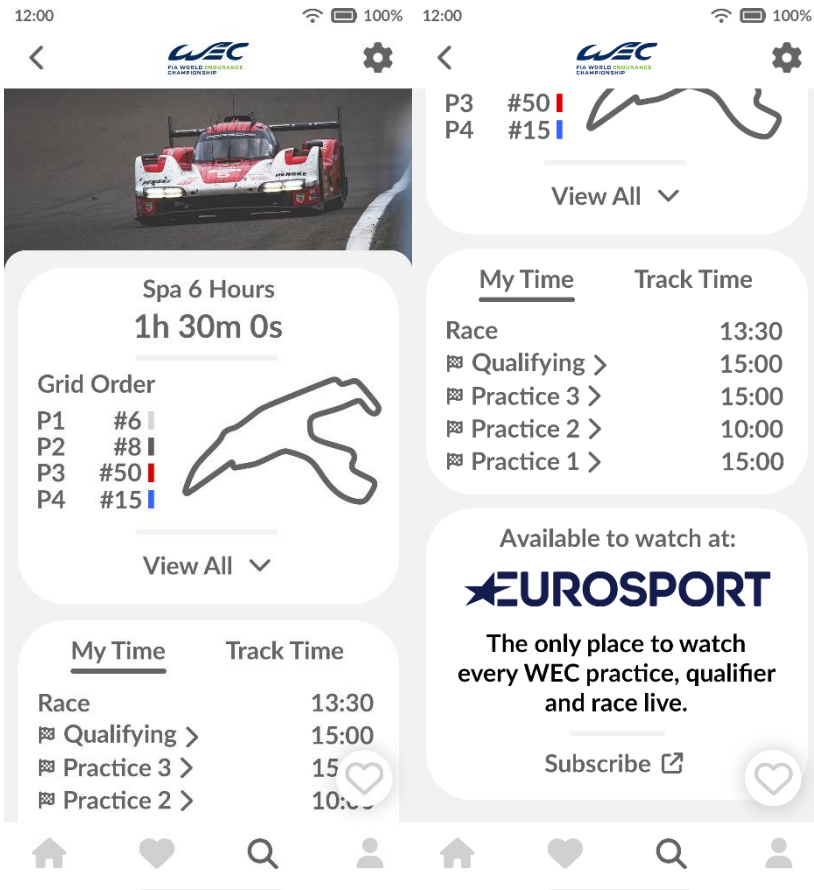

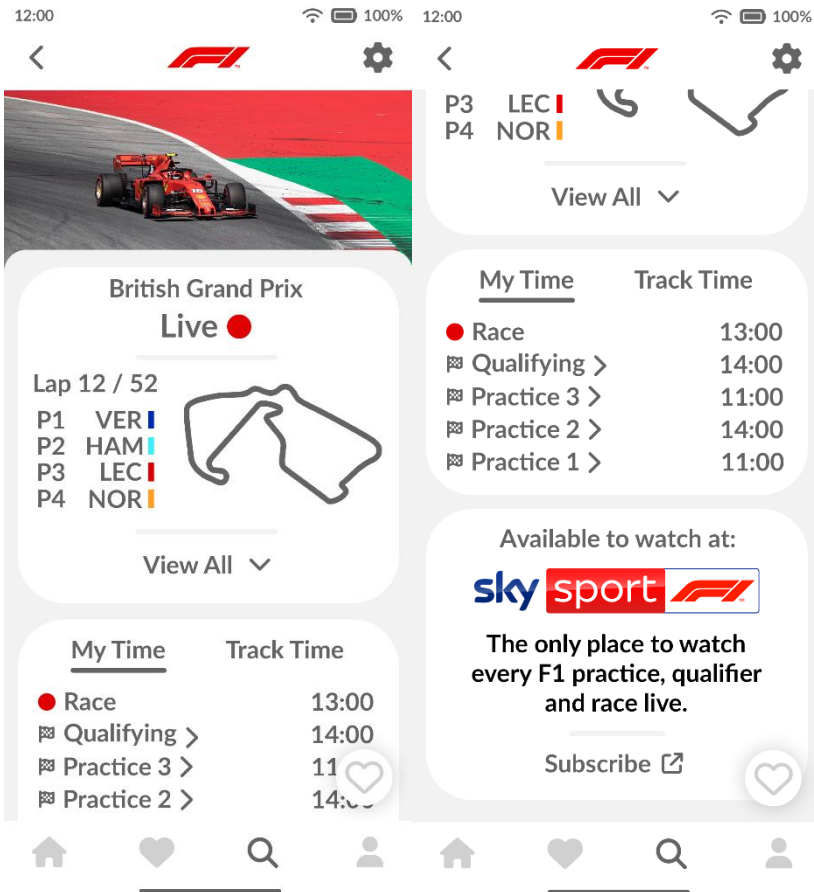

Search Page

The search page allows the user to search through multiple different motorsports. On the initial page, there is a search bar, along with multiple suggested motorsports that the user may like. The user can search for a motorsport of their choosing that may not appear on this initial page, such as a smaller national championship. However, the most notable championships are present on the initial search page. Once the user has found a specific motorsport, they can press on the button and be taken to the specific motorsport page.

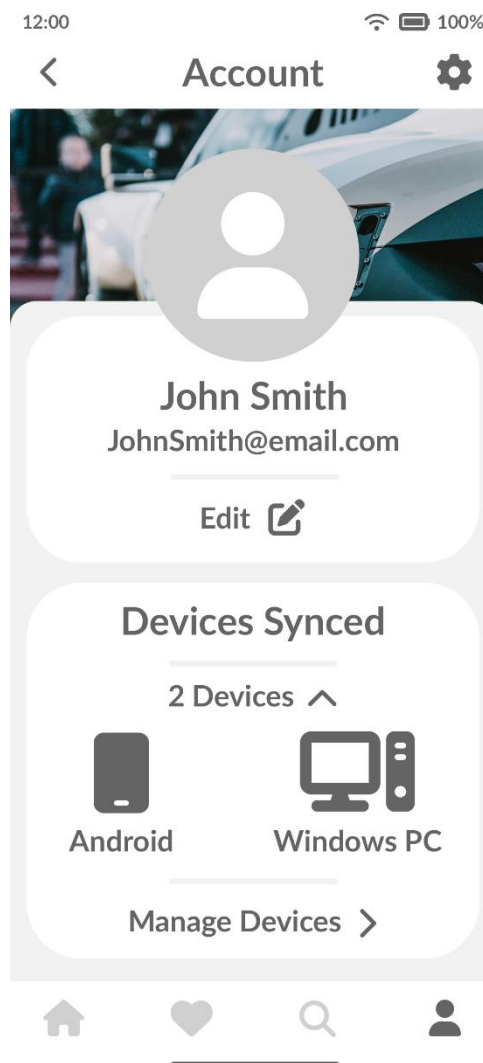

Motorsport Page

Each motorsport on the app will have its own dedicated page. The page will consist of lots of information for the user, including a countdown to the next session, all the session times for that race weekend, results for each session, and where they can watch. The motorsports page can be accessed from the home page, the favourites page, or from the search page. For when a session is live, much like the information on the home page, you will be able to view the leaderboard live, as well as the current lap count. From each motorsports page, you can directly like the motorsport with the like button on the bottom right of the screen. This will add the motorsport to your favourites, which then can be accessed from the home page or favourites page. The user can also toggle the session times from their local time zone, or the track's time zone. If a session is complete, a chequered flag will be displayed next to the session, allowing the user to view the results for that session. Broadcasters can advertise how to watch the specific motorsport, and the user will be provided with an external link to either subscribe or to watch the chosen motorsport.

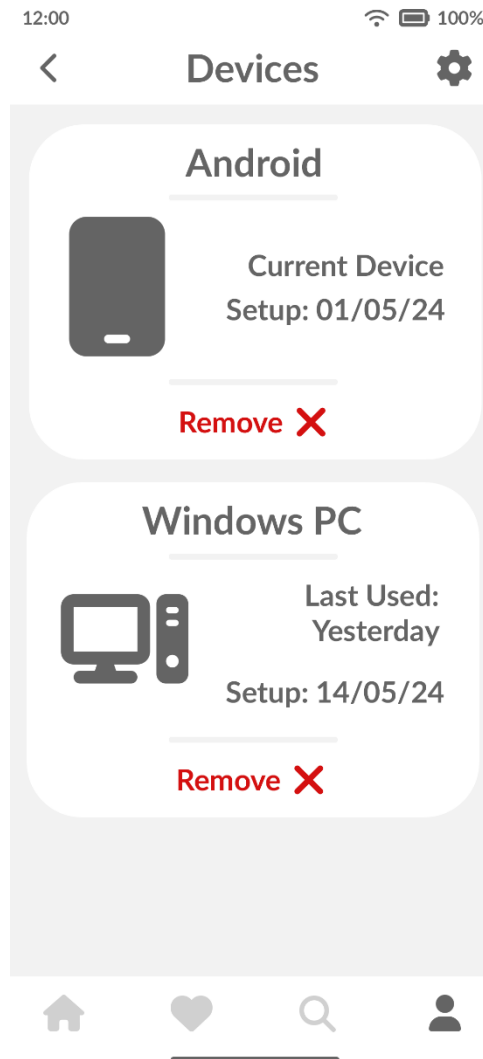

Account

The application features an account system to allow the user to sync multiple devices to receive the same information about their favourite motorsports. This allows the user to easily access the information regardless of the device they are on. When the user loads the application for the first time, they will be asked to log in or to create an account. Once they are signed in, they can view the account's page. This page has a small profile, including a profile picture and a banner which they can modify. They can also edit the name on the account, change the email address, or change their password. In addition to this, they can view the devices that they are signed in on with their account, as well as manage these devices.

When the user presses on manage devices, they will be shown the devices that they area currently signed into. They will be able to view when the device was last used, as well as when it was first setup. They can then choose to sign out the device by pressing remove. This functionality will ensure that the user does not miss out on any racing sessions and that they will be kept up to date with the latest motorsport information across all devices.

Why does it exist?

The project exists as it is a common problem that many motorsports' fans encounter. There is a long and innocuous process to find session times for motorsports that you like and schedule sessions yourself. An application that solves this problem is needed to improve the efficiency of this process, and to keep motorsport fans on top of different championships. It helps motorsport championships and broadcasters too. Individual motorsports can use this platform to advertise their championship, ensuring that viewers don't miss out on their racing. Broadcasters can also advertise their streaming services by allowing users know how they can watch these different championships. By providing this service, it benefits all stakeholders involved in motorsports.

When and where would they use it?

Use of this application isn't bound to a specific time or location. The user could be on the bus home and will wonder when the next Formula 1 race is. The user may have forgotten about a race but will be reminded on their phone when the race is about to start. The user may want to organise their upcoming weekend and will use the application to know exactly when future sessions are. The only restriction to where

the user can use the application is somewhere with internet access. Internet access is required to access the information on their phone, but as the information on the application is light, an intermittent internet connection will work.

Development Report

Development Overview

The development of the prototype began with coming up with an idea for the project, that being of a motorsport application. Once this was completed, I began looking at pre-existing applications that already existed that served a similar purpose. Once I gauged what already existed, I declared some requirements that I want the project to meet. With the requirements set out, I moved onto creating digital sketches for the project, envisioning what I wanted out of the project. I then created my first prototype, proving the concept that I came up with. With the feedback I received from this prototype, I then created my final prototype, which meets all the requirements that I initially set out, allowing a user to manage motorsport session times and view motorsport-related information. I will outline the development process of the project and discuss how the project evolved over time.

Initial Ideas

I came up with a few ideas, but I decided that an application that managed motorsport start times was the best. I was set on this idea as it is an issue that I have personally encountered as a motorsport fan. I had always found that there was not an application that succeeded in solving this problem. Because of this, I wanted an application that fulfilled my needs and would properly solve this problem. After looking at pre-existing applications that served a similar purpose, such as the Formula 1 application, or the Motorsport application, I concluded what my application should achieve and what it should do.

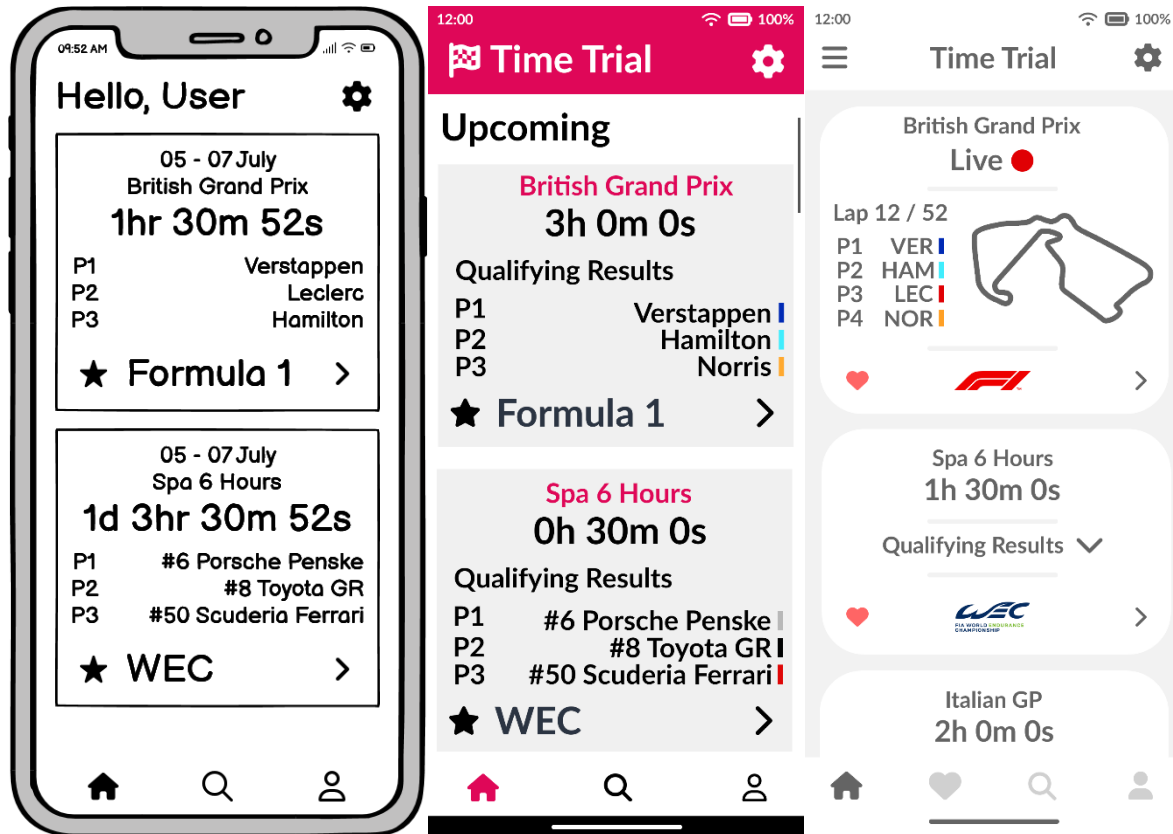

Project Evolution

The project changed multiple times over the course of development in terms of the aesthetics of the prototype and its usability. However, the requirements largely stayed the same from when they were initially set out at the beginning of the project. The initial requirements were that of a motorsport application that allowed the user to choose specific motorsports along with their session times and results, and this was met with the final prototype. I will compare the initial sketches with the first prototype and the final prototype to showcase how the project has developed over time.

Home Page

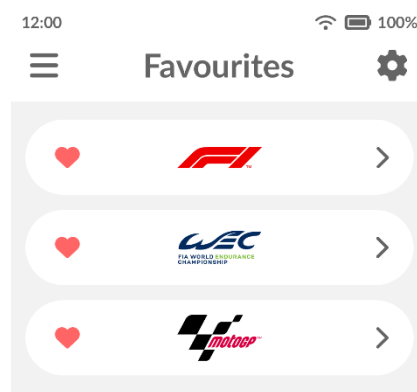

As seen below, you can see that the the home page has largely stayed the same in terms of functionality. You can see that each iteration of the project includes a tile-based design where the information is stored. They all include the title of the session, a countdown to when the session starts, result from the previous session, and a button that links to the specific motorsport page. Across all phases of the project, this idea stayed the same. Improvements were made in terms of aesthetics,

from a very simple design in the initial sketches, to a more modern design in the final prototype design. There was also a slight change of the order in which the motorsport appears. On the final prototype, the motorsports appear in chronological order from the closest time to the furthest time. This allows the user to easily find information about the next session happening.

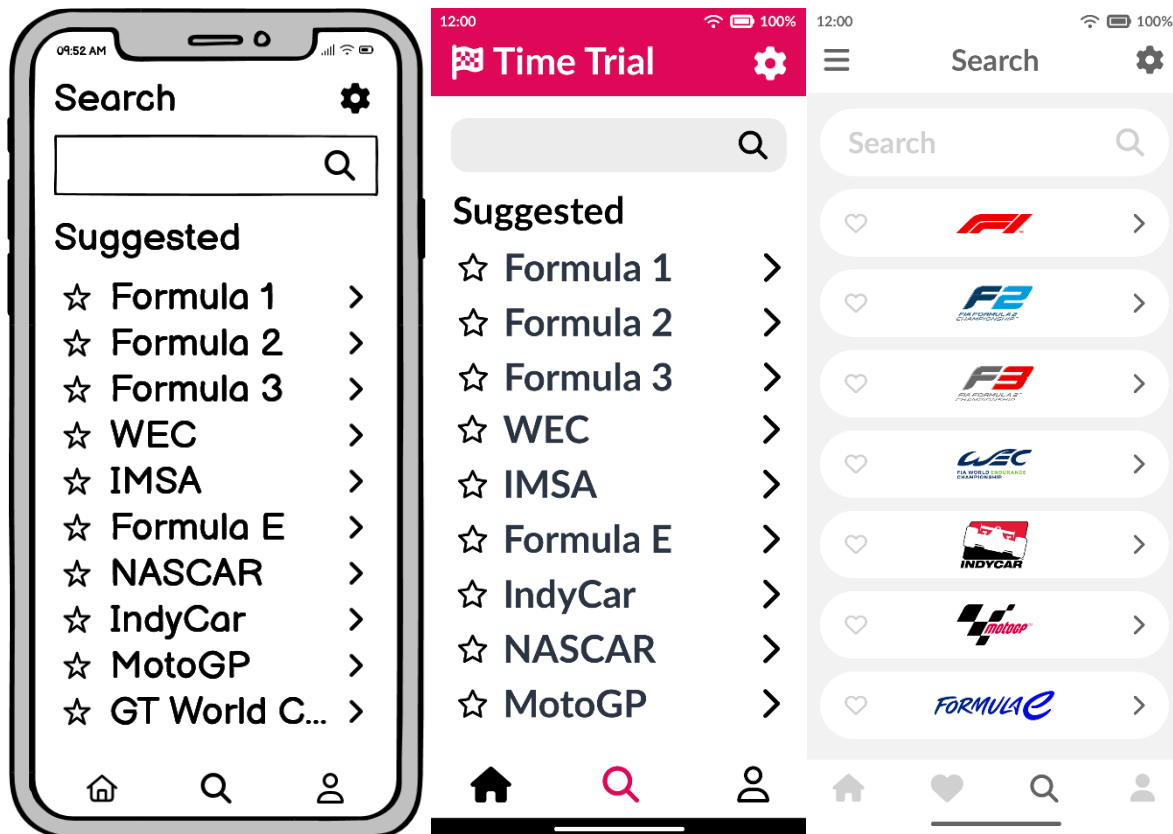

Favourites Page

The favourites page only exists in the final version of the prototype. After the first prototype, I received feedback that there should be functionality added to view their liked motorsports. Otherwise, it would be difficult to navigate through the motorsports which the user has liked. Because of this, I thought it was beneficial to add a favourites page, in which the user can easily navigate through their liked motorsports.

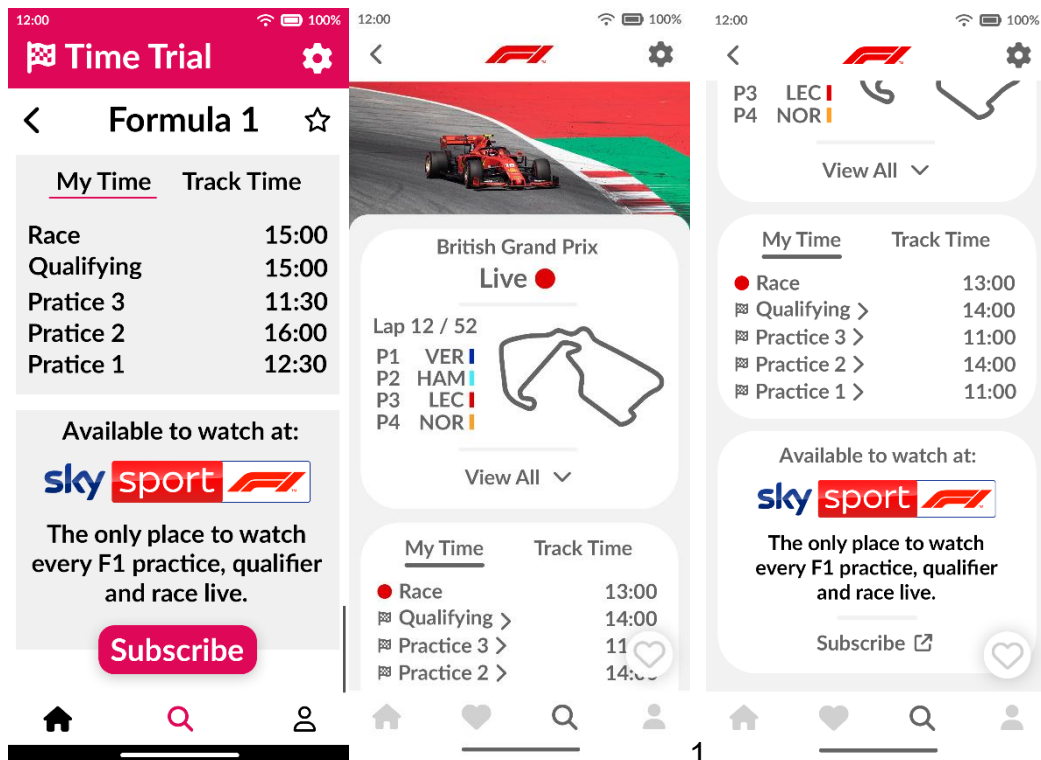

Search Page

The search page, like the home page, also remained largely the same through all stages of the project. There is a search bar that allows the user to enter a motorsport. There are also suggested motorsports that will appear on this page, with the option to favourite the motorsport with the star icon, which later switched to the heart icon. The final prototype is most aesthetically pleasing of all the designs, with use of the motorsport's logo, instead of just the text on the previous designs.

Motorsport Page

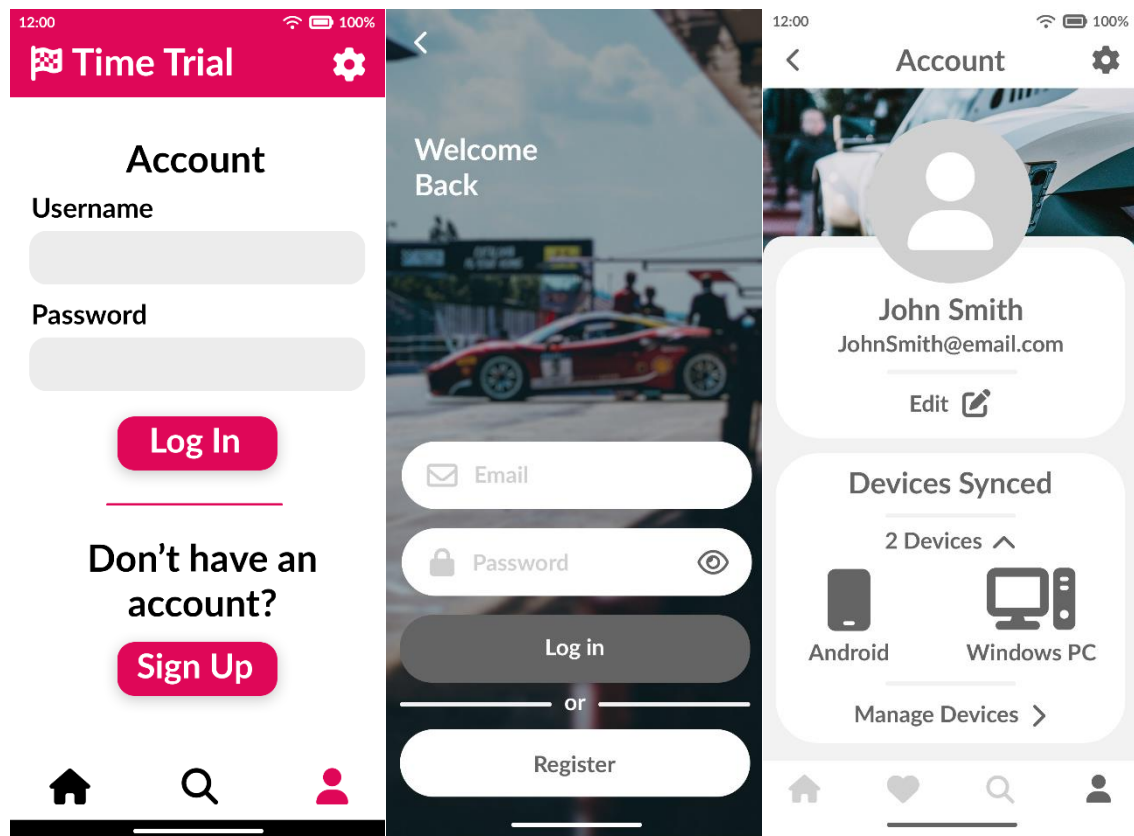

The motorsports page did largely stay the same, although there were some minor changes as the project developed. In each of the designs, the user can see a countdown to the next session and results for the previous session, like what they can see on the home page. They can then see the session times for each session during that race weekend, which can be viewed in the user's local time or the track time. They can then view when they can watch the broadcast, along with a link to subscribe. Some alterations were made, such as the removal of the subscription price. The final prototype also allows you to see the session results for when a session is finished. The final prototype also looks the most aesthetically pleasing with the addition of an image of the specific motorsport, and the addition of the track layout.

Account

The account's page wasn't fully realised until the final stages of the project. The account system wasn't even part of the initial requirements, but I believed that it was necessary to allow users to sync multiple devices together to receive motorsport information. It would save the user from having to set their preferences on each

device they own, as well as constantly updating each device with new motorsports the user has liked. While the first prototype outlined the sign in and log in page, it wasn't until the final prototype which the functionality was fully outlined. The sign in page did change so that the user must sign in before using the application in the final prototype, instead of being able to sign in after using the application. This was done to ensure that likes are synced across all devices and that the user has an account to utilise this system.

Project Technicalities

Apart from the initial sketches, Adobe Photoshop was used to design the prototypes. The tools in photoshop were successful in creating aesthetically pleasing designs for the prototype. In addition to the use of Adobe Xd, I could create functioning prototypes that were successful in bringing the prototypes to life, allowing for the functionality to work correctly and effective navigation through the prototype's pages.

Reflection

From a personal perspective, I believe the project was successful in delivering the requirements that I initially set out. The project went smoothly and there were not too many setbacks, however, there may have been some aspects that could have gone better.

I was most happy with the final prototype that I created. The design is of a high standard, which utilises conventional features that are present in modern applications. It is aesthetically pleasing and is presented in a clean and simple

fashion. I am also happy with how the development took place, with improvements being made each iteration of the project, including the look of the design and the features that were implemented.

There were some aspects that went less well. I should have been more proactive in using my logbook throughout the course of the project. I wish that I had updated my logbook more to reflect the advances in the project, and included some of the more minor milestones that were achieved as the project developed, as opposed to the solely the larger milestones. There were also some difficulties in initially coming up with a design that was appropriate for the application, and therefore I wish that I had came up with multiple designs that allowed me to pick and choose which design was best. However, I do believe that the design that I initially came up with was a strong footing for future iterations.

The project also acted as an extremely useful learning experience. As evidenced through the different stages of my project, I learnt a lot about the aspects of application design, and what are design aspects are conventional in modern applications. As a result of this, I could implement these features in my prototype to produce a convincing and professional application. I believe that the prototype I have created can now be used as a strong baseline going forward to implement a fully working mobile application that allows motorsport fans to manage and view related motorsport session times and information.

Appendix A – Design Logbook

Initial Ideas and Problem Area – 01/03/24

I have come up with a couple of ideas that I have thought about creating for my project.

Idea 1 - Thought Experiment Website

A website that details various thought experiments, such as the infamous ‘Trolley Problem’, allowing users to face ethical dilemmas. Users will then see how other users responded to the same problems, giving them insight into whether they are in the majority or minority.

Idea 2 - Mobile App for Motorsport Start Times

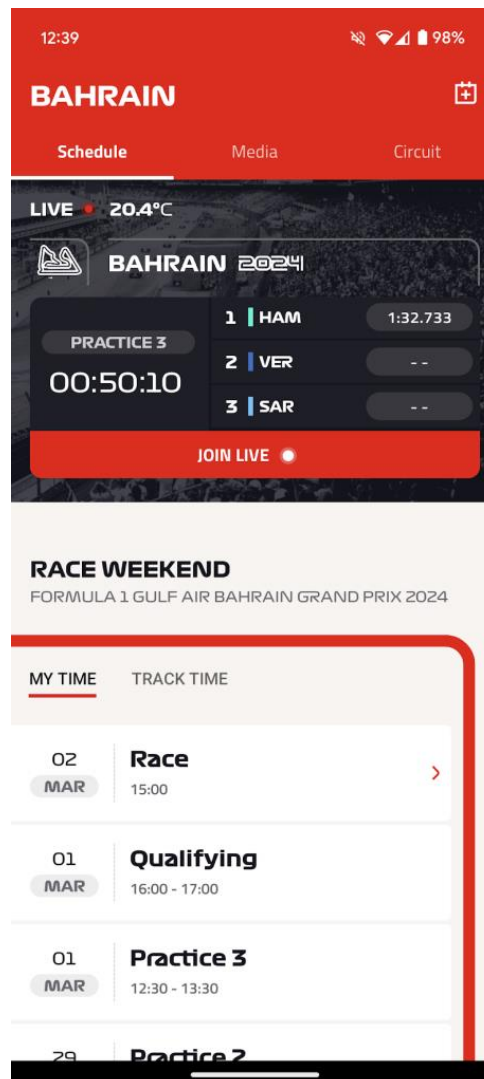

A mobile app that allows users to select various motorsports they are interested in, and get accurate alerts and times about sessions for their specific timezone, as well as seeing the final results for the respective sessions.

Out of both of these ideas, I like the mobile app for motorsport the most, as it is an issue that I have encountered personally and a problem that I would like to solve.

Problem Area

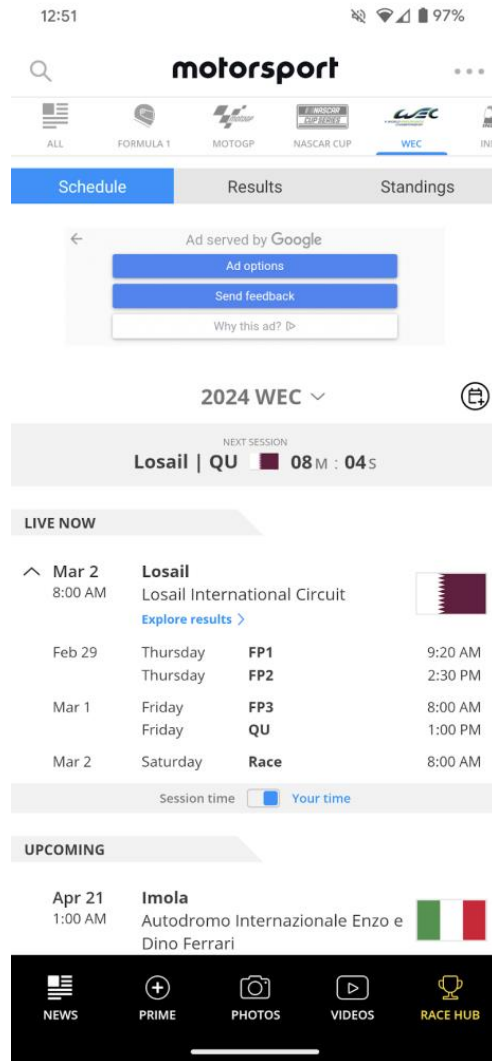

There are a couple existing apps that serve a similar function, but do not exactly solve the problem app. For example, the official Formula 1 app has a way to view session times, upcoming events and countdowns on the application in the user's

respective time zone. While the app is extremely useful, it is only the case for that specific motorsport.

Above is an example of the Formula 1 app. You can see all the session start times in the user's local time, as well as the track time. You will also be able to view the session results during and after a session. When a session currently isn't in progress, then a countdown is shown for the next session. The Formula 1 app does a really good job of allowing the user to find exactly when session times are. However, other motorsports do not employ a similar ease of use.

An application that already combines multiple motorsports into one central hub to view session times is the Motorsport app.

Above is the Motorsport app. By viewing the 'Race Hub' section, you can view a list of multiple preselected motorsports, including the likes of Formula 1, MotoGP, WEC, Formula 2, IndyCar and more. While this solves the problem to some extent, I do feel there is still some issues that are present. For example, not all motorsports are included within the app, such as more smaller championships. As well as this, I have found the start times incorrect at times. I also find the app to be very cluttered at times, and it is difficult to search through all the information on the site.

Hopefully I will address some of the pre-existing issues with this new application and create an app that offers a centralised location for motorsport fans to view motorsports of their choosing and view their respective start times and session results.

Stakeholders and Requirements – 01/03/24

I will outline some of the stakeholders that will use the motorsport application that I came up with. The needs of these stakeholders will help me identify some of the requirements that need to be fulfilled for the project.

Stakeholders

- Motorsport fans
- Friends of Motorsport fans
- Motorsport organisations
- Broadcasters

Needs of each stakeholder

Racing fans

Motorsport fans find it difficult to keep track of start times for sessions as well as the results for that session

This problem is amplified when fans want to track multiple different motorsports and their respective start times and session results

Racing fans want the system to provide a way to select the motorsports they follow and see when sessions start all in one centralised location in their local timezone

Friends

Friends would like to know when their friend is busy watching motorsport

Friends want the system to provide friends with session times so that they know when their friend is busy

Motorsport organisations

Some organisations poorly present their start times, which is a nuisance for fans who have to go out of their way to find what the start time is in their location

Some smaller national motorsports don't have the same recognition as bigger motorsports, and therefore may be harder to find session times for

Motorsport organisations would want to present their sports on the app so that they can gain make sure fans don't miss sessions

Smaller organisations would want to present their sports so that they gain more recognition compared to bigger sports

Broadcasters

TV Broadcasters would want to advertise to fans how to watch their chosen motorsports

Broadcasters want the system to provide users with links to broadcasters websites / apps so viewers can (subscribe to) watch the content

Requirements

A mobile application to allow racing fans to choose various motorsports and view their specific start times and session results

Should allow the user to choose and follow specific motorsports

The motorsports that the user follows should be displayed on the home page

User will receive notification for when sessions are about to start

Application should display the session start time in the user's local time zone, as well as a countdown to when the session starts

Once sessions are complete, users should be able to view the results of the session, including final positions, time difference to leader, lap time, etc.

The application should show a various list of motorsports, from international to national championships

The application should show the ways users can watch the motorsport in the user's location (as well as a link to the stream / link to subscribe)

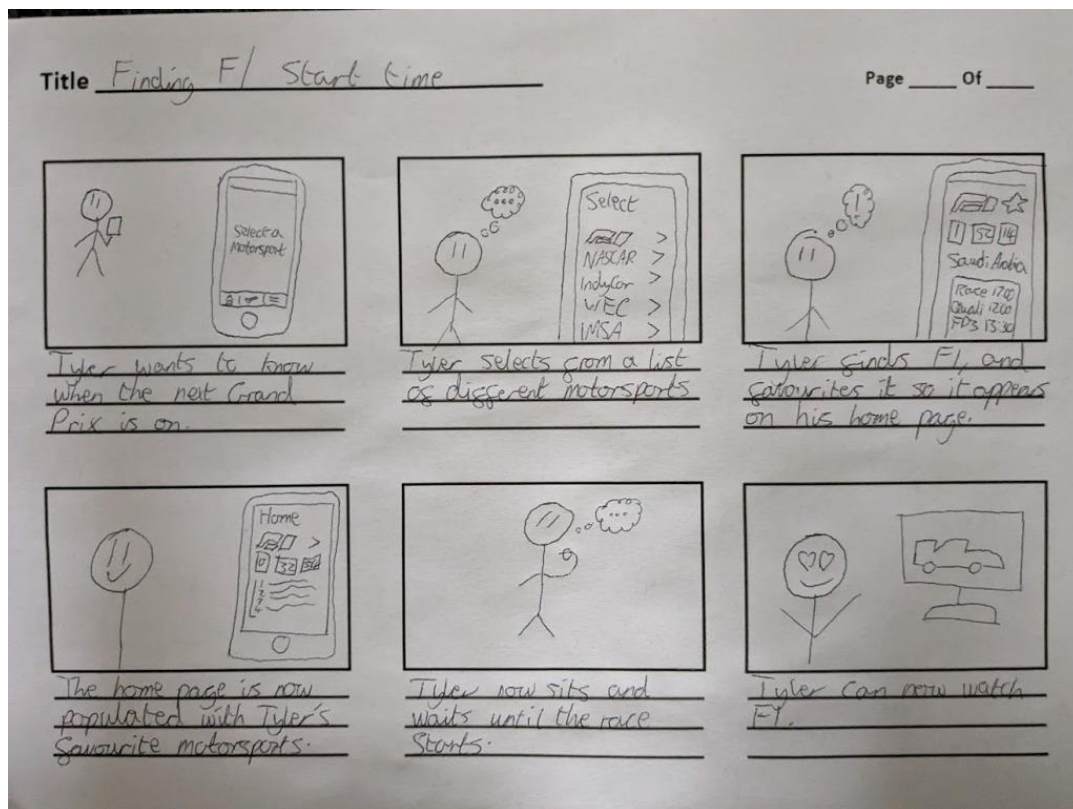

Application should show a list of multiple broadcasters and the different ways they can watch (full session, highlights)

Application should also show prices (free, subscription cost).

First Sketches – 10/03/24

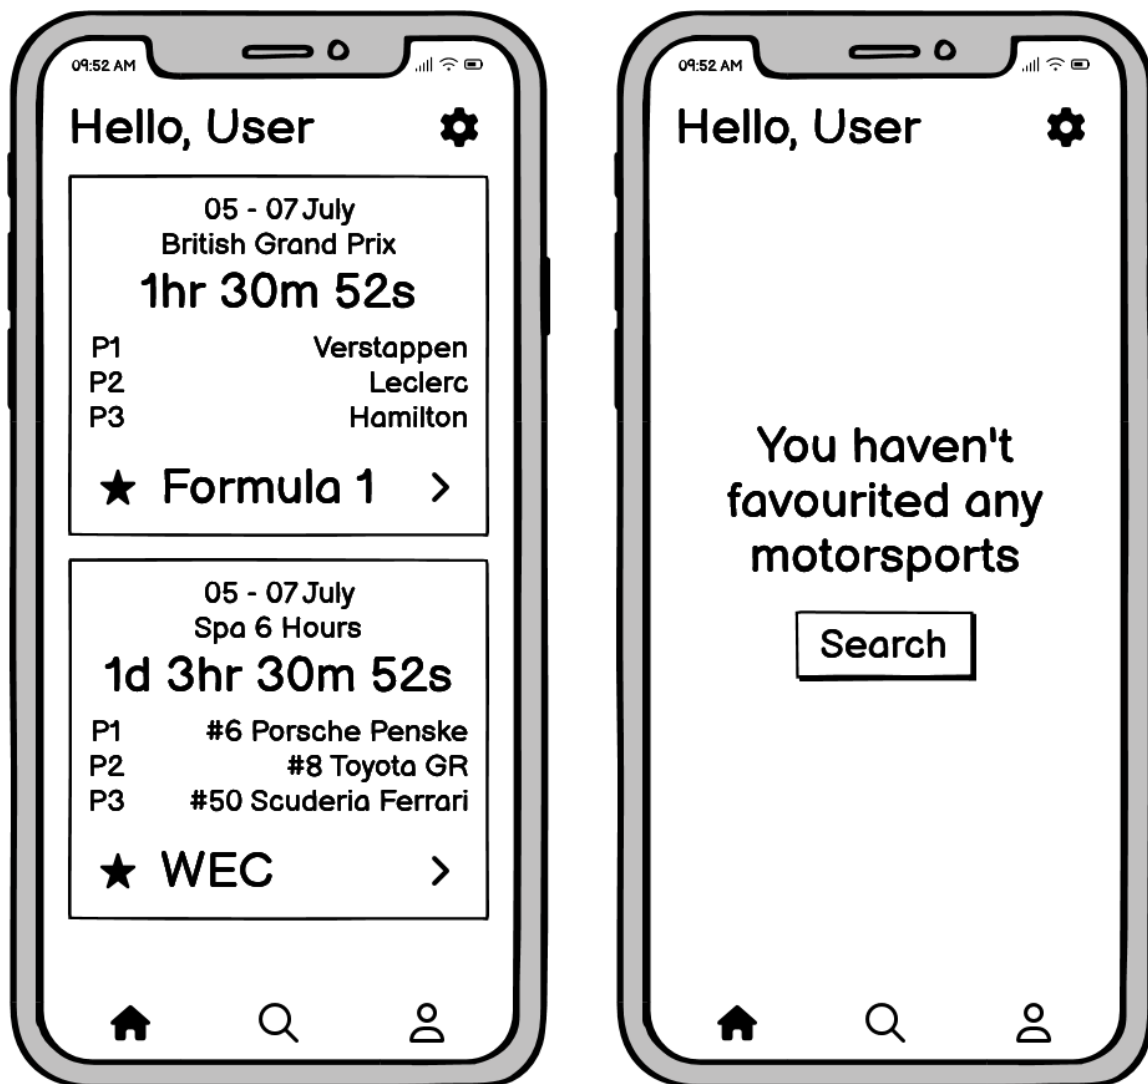

I have created a couple sketches and storyboards to outline how the use cases for the app, as well as start to visualise what the layout of the UI will look like.

Storyboard

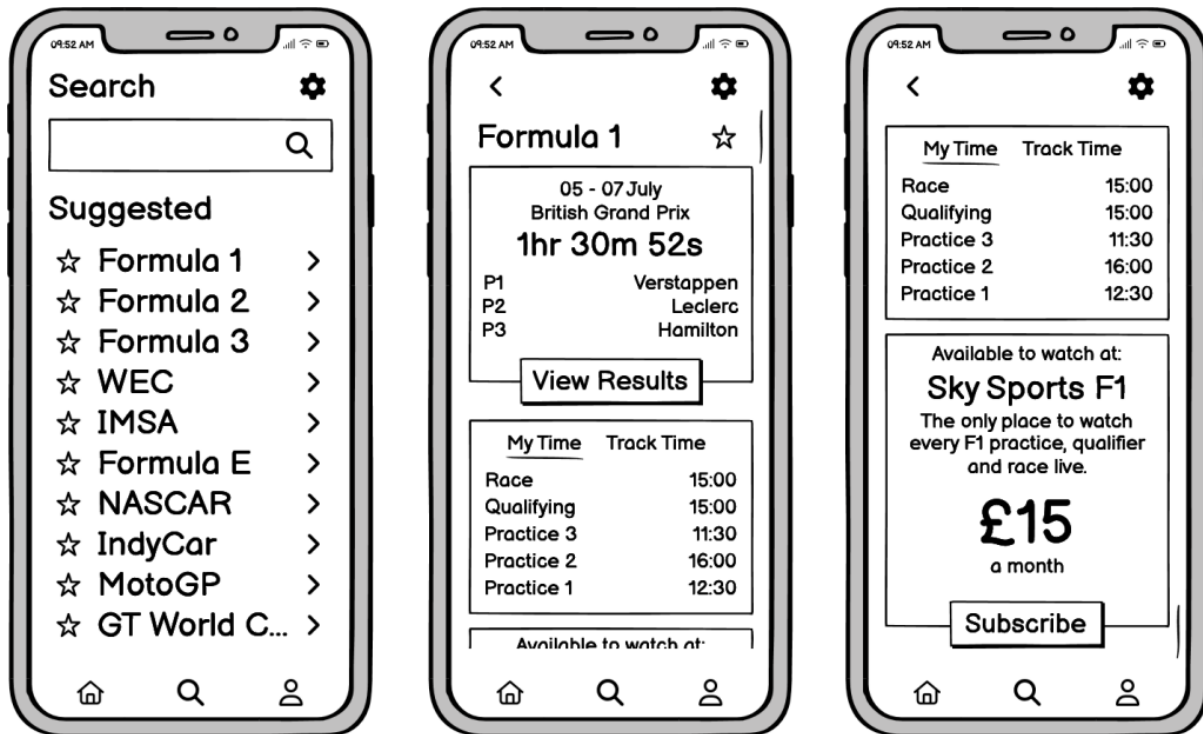

Above is a storyboard demonstrating how the application solves the problem of wanting to find out the start time of a particular race session. The user will load the application, search for a motorsport, press the motorsport they wish to view, favourite it so it appears on the home page, and then wait until the the time to watch the session.

Sketches

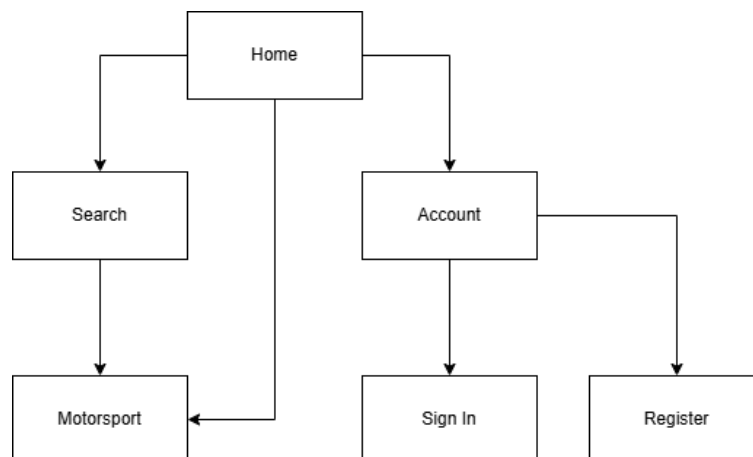

Above shows a digital sketch of two different versions of the home page. On the right side, you will see a home page which doesn't have any motorsports favoured. A button is shown which links the user to search page. The left side shows what the home page will potentially look like when the user favourites different motorsports. They will see a short summary of when the next session is, as well as the results for the previous session. The button at the bottom of each panel will link to a separate page where more information will be presented about session results and times.

Above shows another sketch of the search page. The initial page will present the user with multiple suggested motorsports that they can view. Alternately, they will be able to search for a motorsport, such as a smaller national championship. Once a motorsport is found, they will be provided with information about start time for the next session, results for the previous session and session times for each session during the weekend in the user's local time and the track's local time. Broadcasters will also be able to advertise to allow users to see how to watch that particular motorsport in their respective area, as well as showing how much it will cost each month.

Site Map

Below is a drawing of a possible site map that demonstrates the different pages within the application, and how the user can navigate between each page.

Interaction in Context – 22/03/24

I will begin to identify the context where the users will be interacting with the application. I will also identify the various aspects of the physical environment and how problems will be encountered.

What is the Physical Context?

For the motorsport app that I am creating, the app will be used in multiple locations. I will write a short description for multiple different physical contexts.

The user could be sitting on the sofa at home, and may wonder how long is left until Formula 1 is on. They can then open the app and find a countdown to when the next session is.

The user could be riding a train back home, and may wonder who was quickest in Free Practice while they were at work. They can open the app, and look at the respective motorsport, and then look at the previous session results.

The user could be organising their upcoming weekend at home, and will want to quickly check when the sessions are for their favourite motorsports. They can open the app, view their favoured motorsports on their home page and see when the times are.

Assumptions about the Physical Context

There may be multiple variations in the physical environment. However, most should not impact the usage of the application.

Noise will not be an issue for the application. There will be little to no sound played when using the application. It is possible that the user may miss sound alerts that the app plays, and therefore might miss when a session starts. However, the phone should also vibrate, so this shouldn't be an issue if their phone is on their person.

The time of day won't affect when the user can use the application. Whatever the time of day, the user will be able to access information about motorsports whatever the time of day.

Access to the internet is probably the most important factor of the application. The user will not need constant internet access to use the application, but they will need some connectivity to be able to access the information on the app.

How will variations affect the use of the app?

In regards to access to the internet, this will affect the use of the application as they will not be able to access the information on the app without signal. To encounter this, the user could download the information about timings to their calendar, so that they can access the information offline. However, they will not be able to access information about previous sessions, or be able to access information about new motorsports they haven't downloaded.

What assumptions are you making about the user?

The application should cater to the largest user base as possible. The app should be accessible for a large range of users, especially since motorsport fans cover a wide range of demographics. Young children will be prioritised less as they are not one of the main members of the demographic.

Individuals with sight defects may struggle to use the application, as there is a lot of information on the application, and it may be difficult to search through all the information on the app. As well as this, those with reading difficulty may find it difficult to read through all the information on the application.

Users will be able to multi-task when using the application. The user does not need to be focused when using the application and will be able to access the information they need quickly and with ease.

Interaction Design Principles – 12/04/24

Don Norman's interaction design principles provide a useful guide to how my mobile application should be designed. I will detail each of the principles, and outline how my application will follow the principles.

Visibility

The application should successfully show the available actions and system status. When the user loads the application for the first time, they will be guided on how to use the application. They will be prompted to favourite a motorsport when they first load the app, which will let them undertake the simple process of finding and favouriting a motorsport.

Along with a navigation bar at the bottom of the screen, conventional to other applications, the user should find it easy to see the available actions the user can undertake.

Feedback and Mapping

Feedback is important, especially on mobile apps, to ensure users know their input has been received. The application will include small UI changes to ensure feedback is shown. For example, the navigation bar will update based on the page the user is on, and the icon will switch from being outlined to being filled with a solid colour. When a user favourites a motorsport, the star icon will also be filled with a solid colour and appear on the home page. Buttons across the app will be dynamic and will be outlined when a user taps on a button.

Affordances

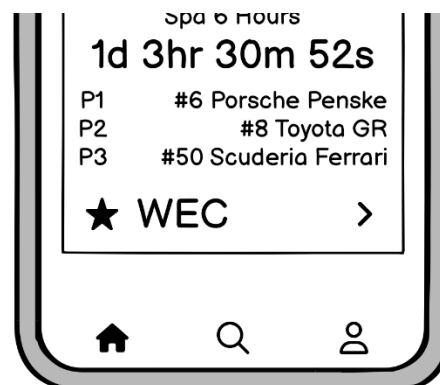

The application should make it clear on how it can be used. As the application is a fairly simple concept, there are not many alternate ways to use the app. The user would most likely perceive the app as what it is intended to be; an application that allows you to track multiple motorsport session times and results in one centralised location.

Constraints

Because of the application's simplicity, there will not be a lot of constraints. There aren't any text fields that the user needs to fill in, or many actions that need to be taken in a certain order. There may be a limit to how many motorsports that the user will be able to view, as the interface may become very bloated as a result, may begin to spam the user with notifications for their favoured motorsports.

Consistency

The application will use the conventional icons and UI design to enable the user to pick up the application easily and navigate effectively through the app. In addition to this, there will be consistent wording, font types, colours and layouts across the application to ensure consistency throughout the application.

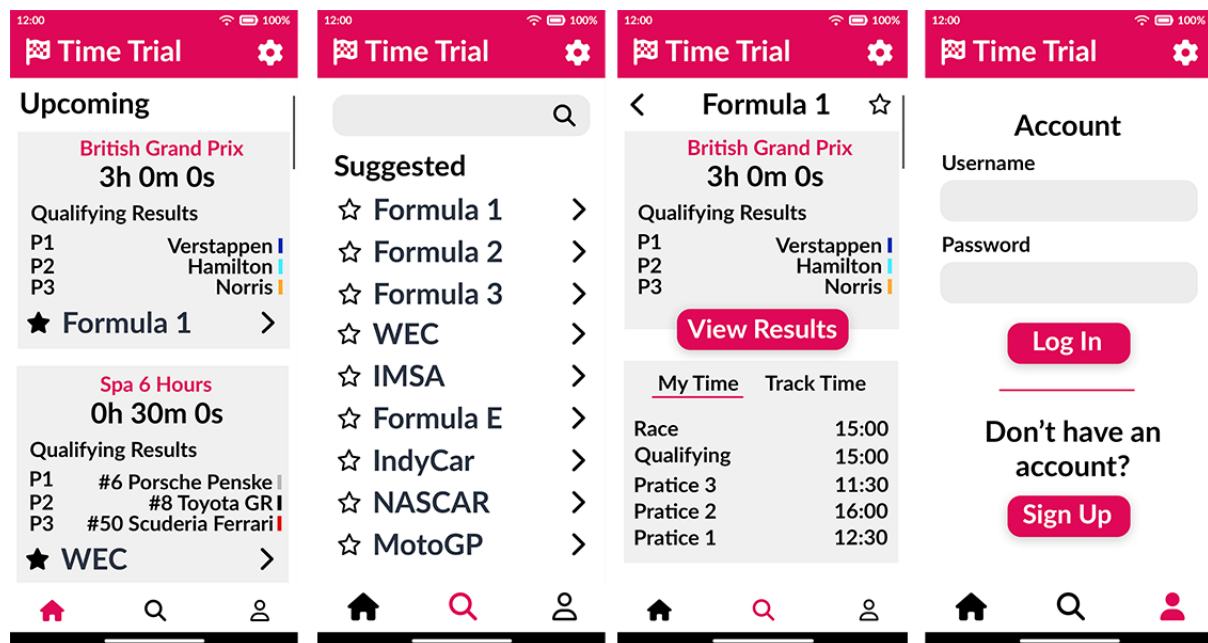

Proof of Concept and Reflection 19/04/24

I have created a proof of concept, which expands the sketches that I created to develop a low-fidelity prototype to demonstrate the basic functionality of the application.

Prototype

Below are screenshots of the prototype. They show the main functionality of the application, along with the various pages that are present within the app. The user can favourite specific motorsports from the search page, which will then appear on the home page.

Reflection

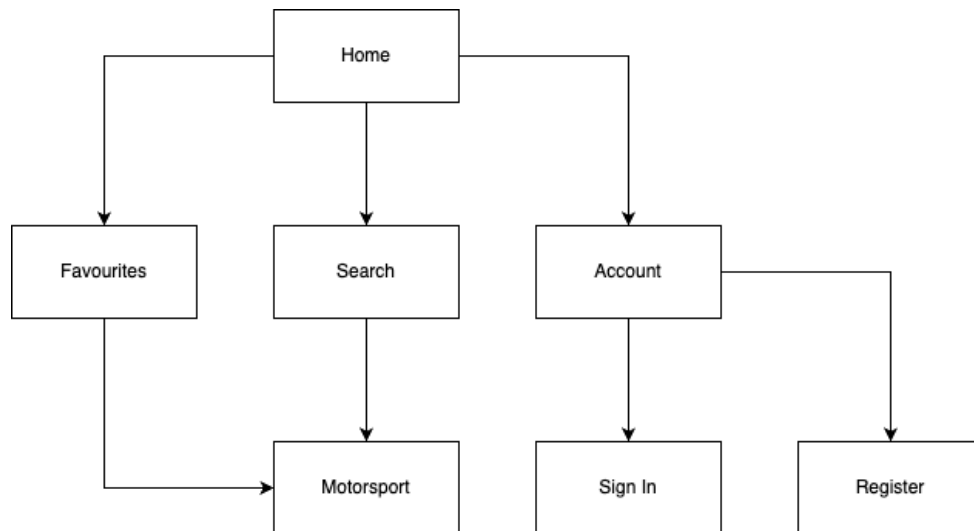

I believe that the prototype has succeeded in meeting most of the aims that were initially set out. However, I do believe this prototype outlines some issues that may need to be fixed in later iterations.

Firstly, I believe that the design of the application is still something that can be improved. A greater variety in colour will make the application more aesthetically pleasing. Small improvements could also be made, such as smaller sizing of the text on screen, as well as improvements to the layout of the information.

Secondly, there could be more features added to make the application more user friendly. It was suggested that a 'Favourites' section could be added, so that when the user has a large amount of motorsports saved, they can search through their multiple saved motorsports with ease, instead of having to scroll endlessly through the home page.

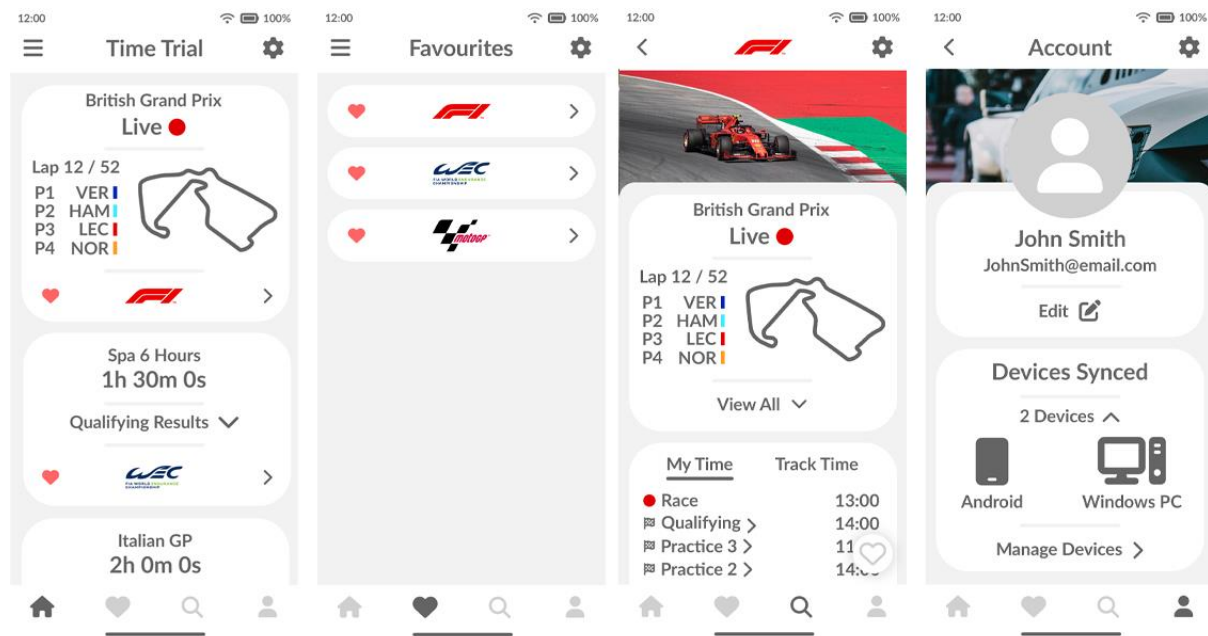

Lastly, the accounts system could be improved in future versions of the prototype. I should make it more fully fledged out to include more information about the user's account, and how having an account can benefit the user; to allow them to sync their preferences across multiple devices.

Below is an updated site map to demonstrate what the next prototype will allow the user to do.

Final Prototype – 27/05/24

I have finished creating a prototype for the app I set out to create. It is a motorsport application that allows users to monitor and schedule upcoming motorsport races in their own timezone with championships that they are a fan of with a personalised home screen. They can sync multiple devices to receive this information and receive alerts about upcoming races and sessions. Below are some images of the final prototype.

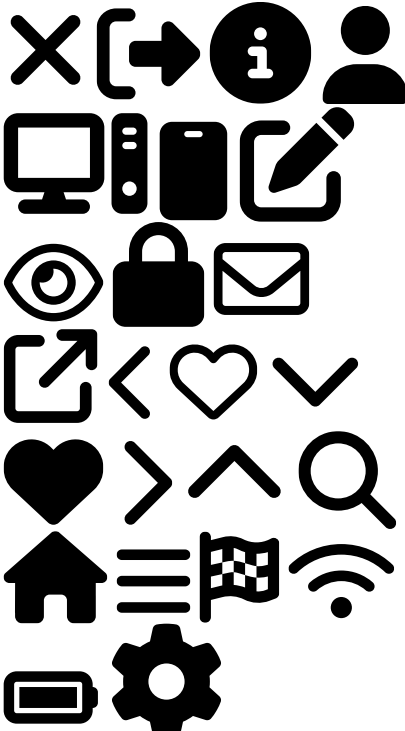

It builds on the previous prototype and has expanded based on the feedback that was given as a result of the proof of concept. It greatly improves the aesthetics from the previous prototype, with a more modern and accessible style. It features a 'Favourites page', where the user can exclusively all of the motorsports they have liked. Lastly, the accounts system now has more depth, allowing the user to view the devices they are signed in on, as well as removing the devices too.
